

Compiler-grounded guidance preserves more of the verification pipeline

A. Query compilation and effect agreement

B. Downstream decision preservation

Same 21 tasks and program corpus across conditions; all three task-level translation repeats shown. Agreement is not correctness. Reference-effect equality is a compiler-representation check. Panel B excludes 710 supplied-query-unavailable programs; the full corpus has 2,238 programs. Default verifier semantics; residual obligations remain. Supplied queries are controls, not independently validated gold.
